Lift pits are extremely susceptible to water ingress, and treating the problem can be expensive, time-consuming and often unreliable.

PRS has the answer – whether a lift pit in a brand new building, in a building under construction or an existing lift pit made from concrete, brick or block.

Employing state of the art technology from world leading company, MC Building Chemicals, PRS can solve your lift pit problems once and for all.

Using specialist injection technology, one of a range of methods is employed to provide a permanent solution to water ingress.

One of our range of injection technology equipment

Tried and tested, it is currently being used to waterproof tunnels and other earth retaining structures across the UK.

PRS is one of the few accredited contractors in the country and has already completed a number of lift pit repairs with great success.

The accreditation involved a considerable amount of training, in the UK and at MC Building Chemicals' headquarters near Dusseldorf, as well as a significant investment in equipment.

To discuss the technology and its application in more detail, please contact us. We will also be able to illustrate how it has worked for other clients.

PRS offers in-house demonstrations of the products from MC Building Chemicals. This can be carried out as a CPD qualifying seminar on the waterproofing of below ground structures.
